Waltman Rest Area

During the winter of 2004, a recirculating sand filter (RSF) system was installed at the Waltman Rest Area near Waltman, Wyoming.

Wastewater flows from the rest area, which varies from a few hundred gallons per day (GPD) to a few thousand GPD, will be treated by two 10,000-gallon septic tanks followed by a 5000-gallon recirculation tank. Pumps in the recirculation tank dose a 2000 square foot sand filter for treatment. The treated effluent then passes through ultraviolet disinfection units before being land applied with a sprinkler system.

Permitting Authority: Wyoming Department of Environmental Quality

Project Engineer: WWC Engineering

System Installer: 71 Construction

Operator: WDOT Staff
